### Message from the Guest Editors

The forest-transition (FT) concept refers to the long-term evolution of the forest cover in a region or country. This concept, first established in the field of geography upon empirical evidence, has since been apprehended by economists. This framework allows investigating the links between long-term economic development and land-use change. The dynamic perspective gives insights into the factors that help to halt deforestation, the ones determining forest composition in the recovery process, as well as the level of forest cover that can be preserved.

The aim of this Special Issue is to give an overview of recent work that relates forest transitions with economics. Theoretical papers using optimal control are expected, as well as empirical papers assessing global and particular patterns of forest transitions, together with issues of land-use displacement related to international trade.

## Message from the Editor-in-Chief

*Forests* (ISSN 1999-4907) is an international and cross-disciplinary, scholarly forestry journal. The distinguished editorial board and refereeing process ensures the highest degree of scientific rigor and review of all published articles. Original research articles and timely reviews are released online, with unlimited free access.

Our goal is to have *Forests* be recognized as one of the foremost publication outlets for high quality, leading edge research in this broad and diverse field. We therefore invite you to be one of our authors, and in doing so share your important research findings with the global forestry community.

## Author Benefits

**Open Access:** free for readers, with article processing charges (APC) paid by authors or their institutions.

**High visibility:** indexed by the Science Citation Index Expanded (Web of Science), Ei Compendex, GeoBase, Scopus and other databases.

**CiteScore** (2018 Scopus data): **2.32**, which equals rank 20/139 (Q1) in the 'Forestry' category.
